IMPLEMENTING TAKT PLANNING AND TAKT CONTROL INTO RESIDENTIAL CONSTRUCTION

Joonas Lehtovaara - Doctoral Candidate, Department of Civil Engineering, Aalto University, Finland
Iina Mustonen - Site Engineer, Fira Oy, Finland
Petteri Peuronen - Production Engineer, Fira Oy, Finland
Olli Seppänen - Professor of Practice, Department of Civil Engineering, Aalto University, Finland
Antti Peltokorpi - Assistant Professor, Department of Civil Engineering, Aalto University, Finland
Research background

- Recently, production planning and control methods *Takt Time Planning* (TTP) and *Takt Planning and Takt Control* (TPTC) have received attention within the Lean Construction community.

- Amongst other advantages, TTP and TPTC have shown great potential in radically decreasing production durations, and for example, Frandson et al. (2013) and Binninger et al. (2018) have documented 55% and 70% reductions, respectively, in durations by implementing takt production.

- The benefit of takt surfaces from its structured and methodological way of planning as well as daily control of the production, and therefore, achieving stability and continuous flow.
Research gap

- As takt planning and control is by its nature suitable for highly repetitive work, it would appear to be suited especially well for the interior phase of residential construction. However, little empirical research exists on takt implementation in residential construction projects.

- Also, only a few studies have documented the actual implementation and critical analysis of takt control phase.

Research aim

- Therefore, research is needed on investigating that are the methods used in other instances applicable to repetitive residential construction.

- Research questions:
  1) Is takt production suitable for improving flow efficiency and shortening overall duration in the interior phase of a residential construction project?
  2) Which barriers, enablers and possible actions for development appear while implementing takt production in residential construction?
Research methods – a qualitative case study

- **Case**: Interior phase of Finnish residential project
- **Data sources**: 14 interviews, site visits, project documentation, digital planning and monitoring tools (no quantitative analysis, only to support the findings)
- **Focus areas**: technical aspects (planning, control, management, training, visualization) and social aspects (involvement, leadership, satisfaction)
- **The analysis** aimed to identify lessons learned as well as required future development actions in takt implementation
Takt planning

1. Gather information,
2. Define areas of work (zones)
3. Understand the trade sequence
4. Understand the individual trade durations
5. Balance the workflow
6. Establish the production plan

Iteration with subcontractors

Takt control

Weekly takt control meeting
Weekly contractor meeting
Weekly site manager meeting
Daily control with discussions & digital tools
Implementation aim: increased flow efficiency and radical duration decrease
## Lessons learned related to planning

# Lessons learned related to control

<table>
<thead>
<tr>
<th>Category</th>
<th>The most significant barriers</th>
<th>Recommended enablers and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Takt control</td>
<td>Takt implementation was not fully addressed beforehand, hard start was too intense</td>
<td>• <em>Mutual understanding of takt production requirements should be ensured through intensive training and a softer start</em></td>
</tr>
<tr>
<td>Management of trades</td>
<td>Daily control was not fully addressed; advantages of new implemented tools not fully realized until the last stages</td>
<td>• <em>Daily control and full awareness of every actor on the site is required; effective learning requires better mutual understanding</em></td>
</tr>
</tbody>
</table>
Conclusions

- Takt was found suitable for improving flow efficiency and reducing duration of the interior phase of a residential construction project.
  - Duration reduced approximately 30%
  - Better transparency and possibility for continuous learning
  - Better proactive tackling of problems as they appear
  - However, the implementation required significantly increased effort

- **Planning**: Holistic approach to takt production between design, planning and procurement – ”design for takt”

- **Control**: Clear methods for management, better collaboration with participants in production

- The found barriers should be actively tackled through continuous improvement over projects
Avenues for future research

- Further research is required to generalize the results.

- The future research could include
  - (1) addressing long-term effects takt production over several projects, and
  - (2) more thorough comparison of different takt methods and implementation cases.
Thank you!
