DEFINITION OF MATURITY

IGLC 28

BERKELEY, CA 6-12 JULY 2020

28th ANNUAL CONFERENCE OF THE
INTERNATIONAL GROUP FOR LEAN CONSTRUCTION

Maturity is the state of maximum development, or state of excellence, that offers the ability to make the projected objective come true with the most efficient use of available resources. It is a state that is gradually reached by going through different levels of maturity, which allow us to escalate towards a maximum standard, a reference level of excellence for the context, a “Gold Standard.” (Cano & Rivera, 2015).

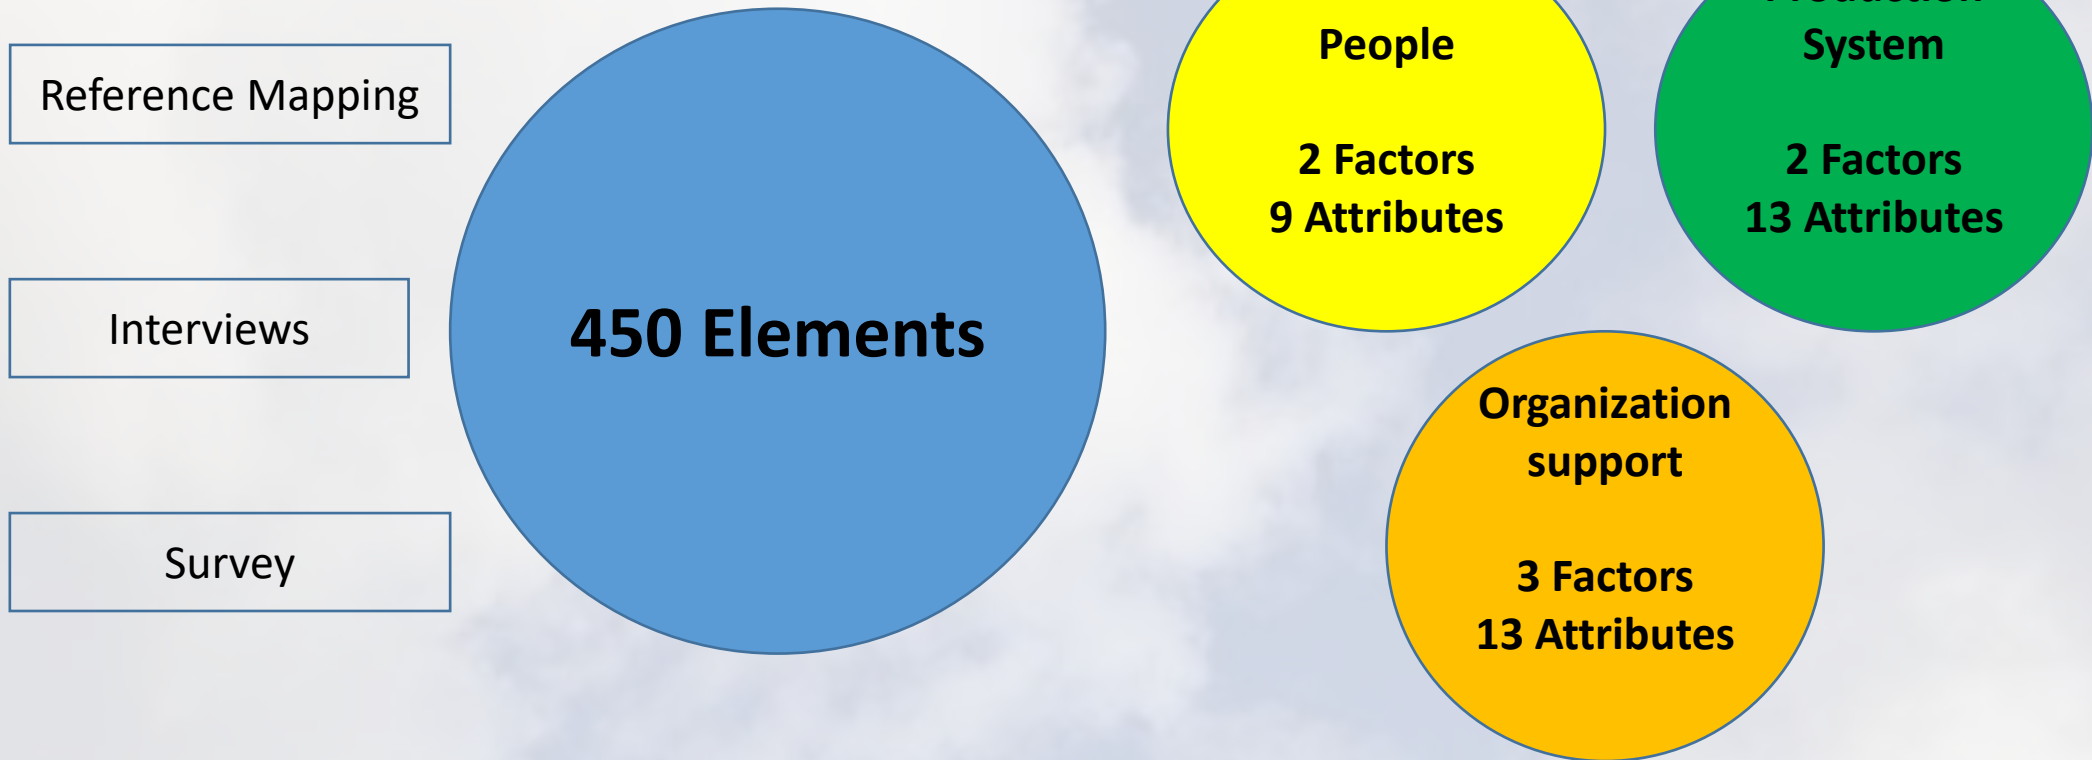

Methodology

BERKELEY, CA 6-12 JULY 2020

28th ANNUAL CONFERENCE OF THE
INTERNATIONAL GROUP FOR LEAN CONSTRUCTION

Then....

The maturity model makes possible to have a comparative information that can be used to develop an organizational improvement plan.

Utility of the maturity models

IGLC 28

BERKELEY, CA 6-12 JULY 2020

28th ANNUAL CONFERENCE OF THE
INTERNATIONAL GROUP FOR LEAN CONSTRUCTION

The Maturity Models assess the maturity of elements in the process to define the maturity level reached by the system.

This assessment is represented by maturity levels.

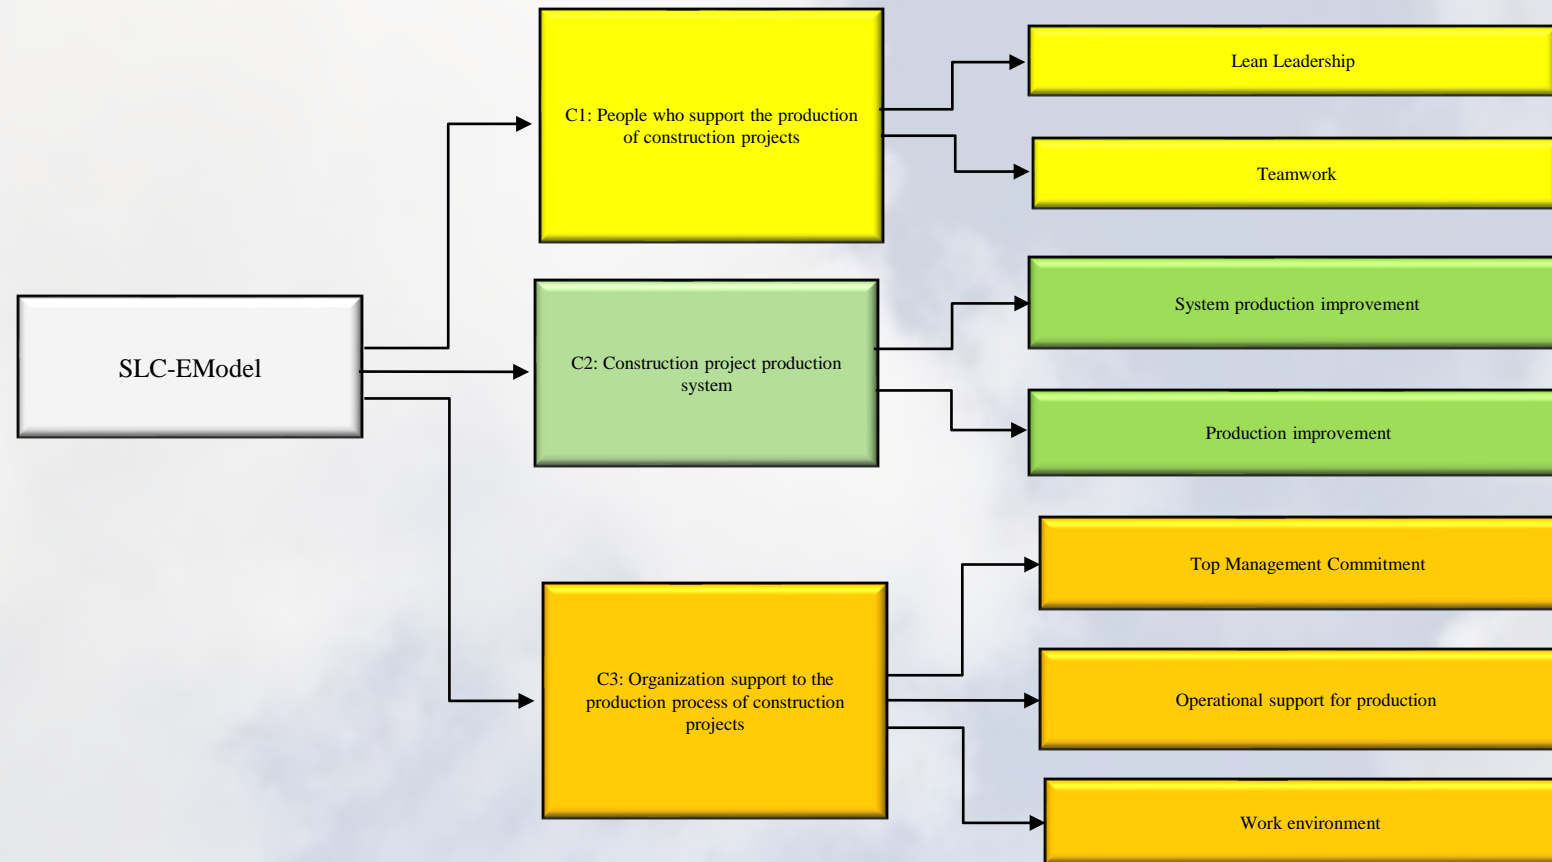

Categories, factors, and attributes

Example

Current IGM = 1,33

IGM Objective = 2,0

Conclusions

IGLC 28

BERKELEY, CA 6-12 JULY 2020

28th ANNUAL CONFERENCE OF THE
INTERNATIONAL GROUP FOR LEAN CONSTRUCTION

- This model was designed to assess the maturity of Lean Construction in the CPM. However, its development allows it to be adapted and applied to other contexts and production processes.
- The SLC-EModel has the ability to explain the phenomenon of maturity in this and any productive sector, considering that any production system has the same categories as those defined in it.

Conclusion

IGLC 28

BERKELEY, CA 6-12 JULY 2020

28th ANNUAL CONFERENCE OF THE
INTERNATIONAL GROUP FOR LEAN CONSTRUCTION

- In the project production system, people are the essential component for the production process. In the construction project, all operations are carried out with people who constitute work teams, and the team's work builds their work environments. In this way, companies must concentrate their efforts on the formation of human capital to build an Lean Construction culture.
- The production process of the construction project requires people trained with attitude and willingness to work and improve continuously, a production system, and organizational operations at the service of the project that effectively contribute to the production flow.

Conclusion

IGLC 28

BERKELEY, CA 6-12 JULY 2020

28th ANNUAL CONFERENCE OF THE
INTERNATIONAL GROUP FOR LEAN CONSTRUCTION

- To adopt and apply manufacturing technologies in the construction industry, a better understanding of innovation management practices is required. An evolution model must be a simple tool to apply, which systemically includes people at different levels of the organization.
- The authenticity of the elements identified and the relationships between them are ensured since the results broadly represent the phenomenon of maturity observed objectively. The results of the SEM clearly and broadly represent the constructs to which it refers.

Future work recommendations

IGLC 28

BERKELEY, CA 6-12 JULY 2020

28th ANNUAL CONFERENCE OF THE
INTERNATIONAL GROUP FOR LEAN CONSTRUCTION

- For the implementation of the model, it is required to apply in the field the attributes assessment. Due to the high volume of information to evaluate the model, a software tool must be developed to provide the maturity rating.
